

SECURITY

MEET TODAY'S SECURITY CHALLENGES HEAD-ON

Safe and secure with next-generation cyber security

At IGC, the only thing we take more seriously than the performance of your IT infrastructure is its security. After all, a data breach can not only be extremely costly, but damaging to your reputation as well.

Our comprehensive suite of Managed Security Solutions helps assure the integrity, safety, availability and compliance of your private and public cloud infrastructure, dedicated hosting or hybrid IT environment. You can trust us to safeguard your valuable data in storage, in transit and everywhere in between.

.We've Got Your Back

We work to keep the bad guys out. Our highly available and flexible managed firewall solution provides isolation through multiple security zones and enables you to tailor your security policies based on source and destination IP addresses and traffic protocols.

Our solutions enable you to:

- Increase firewall capacity as you need it
- Get seamless configuration changes and upgrades, so you're never left exposed
- Acquire secure connectivity for mobile and office workers with client-based and site-to-site VPN

Our Anti-Virus solution protects your critical systems

from infection. Host-based anti-virus software protects your infrastructure from the viruses and malware behind 40 percent of all data breaches. Our managed solution defends servers by scanning for and remediating viruses, malware, dangerous programs, spyware and many other threats.

Our Threat Management (Intrusion Detection and Prevention) responds rapidly to attacks, working with our managed service to create a formidable defense against intruders. And a team of seasoned, professional security specialists help neutralize threats before they become problems.

Our Operating System Patching prevents vulnerability to exploits. Bugs and the vulnerabilities of operating systems and applications present the possibility of unauthorized access to systems and data. If your systems aren't updated on a regular basis, you remain at risk for zero-day exploits. Our regularly scheduled monthly maintenance window and critical updates protect your systems.

Our Managed SIEM (security information and event management) solutions, supported by the Alchemy Security virtual security operations center, provide the best of security and compliance solutions. Not only do these solutions comply with standards such as PCI DSS, HIPAA, GLBA and ISO 27001, but you're provided with log collection, log retention, log analysis, vulnerability scanning, compliance tracking and reporting, file integrity monitoring, host-based intrusion detection, IP threat correlation and security incident management.

Meet today's security challenges head-on, and allow IGC to provide the integrity, safety, availability and compliance required for your IT infrastructure.
